

CRAZIEST WAYS FOR THE WORLD TO END SPACE

ROGUE BLACK HOLE

There are believed to be hundreds of rogue black holes in our galaxy. Each follows a very unpredictable path through space. If even one passes close to our solar system then humanity has very little hope of survival.

COSMIC DUST CLOUD

The solar system might pass through a region of space with dust and gas a thousand times denser than now. This cloud would eat away at our atmosphere and limit the amount of light reaching us from the sun.

SOLAR STORM

A strong burst of electromagnetic radiation from the sun has the potential to cripple much of the technology on earth. Such an event would cause widespread chaos and the possible end of our modern society.

PLANET X

This internet conspiracy just won't seem to die. The story goes that a large planet on an irregular orbit is headed directly towards earth. A planetary collision on this scale would end almost all life on Earth.

ALIEN PLAGUE

Similar to the horror that befell the Native Americans, humans might have no immunity to new extraterrestrial microbes. Whole chunks of the human population could be wiped out and modern medicine could do very little.

MARS REVOLUTION

Assuming Elon Musk delivers on his dream and humans colonize the red planet. What is to stop a future generation of Martians from throwing off the chains of the Earthling oppressors and attacking Earth.

SUPERNOVA

A gamma-ray burst from a supernova would strip the Earth of its ozone layer exposing all life to massive doses of uv radiation. A Supernova might also cause conditions that lead to a prolonged cooling of the planet.
